

2023 tactical adaptation is also a response to defence – dominant conditions. However, the very factors that make these studies valuable – timeliness, access and operational security constraints – also reduce transparency and limit independent auditability.

2025, WATLING 2025 B. This is consistent with what would be expected by scholars of military technological change, who note that the Ukrainian War has become a 'positional' not a manoeuvre war, adding further nuance to apparent drone implications.

enable 2024, BRONK 2025, WATLING 2025 B – tightening the kill – chain rather than substituting for it – while also offering options for mass precision strike. WATLING 2025 B reports that tactical strike weapons payloads are often too heavy to be carried by a single aircraft, improving the efficiency of scarce artillery fires – even as drones themselves remain highly effective for disrupting and attriting light infantry and combat services support. The Ukrainian War can be attributed to compensating for shortfalls or an attribution bias through video –

Pre-war military-tarries must preserve combat-power relative to assessed adversaries, even though preparing to 'fight the last war' risks obsolescence. The in-

heavy reporting. While WATLING²⁰²⁵ B nonetheless attributes sixty to seventy percent of Russian losses to OWA⁴, it has
